Abstract

A rise in second-generation migrant entrepreneurs and an increasing focus on modern economic sectors have become new trends in migrant entrepreneurship in recent years. Although traditional sectors are still the most popular among the first-generation migrant entrepreneurs, because of the increasing pressure and their high competitiveness in traditional areas, nowadays new market niches are rapidly developing. While the first generation has more often become active in new areas such as the producer services sector which includes finance, insurance, real estate and business-related professional services, the second generation has contributed to the emergence of new areas of immigrant business activity such as the ICT sector and the creative industries.

Against this background, this study focuses on the external orientations of the second-generation migrant entrepreneurs by addressing in particular the way – and the extent to which – the choice for entrepreneurship is made by higher-educated young ethnic generations. This is a new field of entrepreneurship research in many European countries. The empirical data of our study is based on in-depth personal interviews held in the first half of 2007. We employed a recently developed multivariate qualitative classification method, coined rough set analysis, in order to investigate the motivation, goals and strategies of second generation Turkish entrepreneurs in the ICT and the financial services sector in the Netherlands.

The results of our study show that the second generation Turkish entrepreneurs in the Netherlands have started to be involved in new and non-traditional sectors like ICT and financial services sectors. The motivation and driving forces of the second-generation Turkish entrepreneurs are stemming from both their personal characteristics shaped by their higher educational level and their previous working experience as an employee or entrepreneur in the same sector. The demand for and a gap in the sector as well as the growing and promising structure of the sector play also an important role in pulling the second generation Turkish immigrants to become entrepreneur in these new sectors.

Keywords: second generation migrant entrepreneurs, sectoral change in migrant entrepreneurship, Turkish migrant entrepreneurs, ICT and FIRE sector, Amsterdam

1. The New Demography as an Entrepreneurial Driver

Innovation — a significant improvement (and market acceptance) of (part of) our production or governance systems — has been a central instrument of any market-driven economy since the early history of mankind. It has been a focal point of economic theory and applied economic research since the postwar period, with different cycles of interest in the past sixty years. A first wave of economic interest can be found in Schumpeterian theory on innovation and entrepreneurship (see Schumpeter 1957). Next, the recession in the beginning of the 1980s prompted a new phase of interest instigated by a revival of long wave (Kondratieff) theory (see Kleinknecht 1982). And finally, in recent years we have witnessed another wave of interest in innovation and entrepreneurship, mainly as a result of global competition on the one hand and reinforcement of local growth potentials on the other (see de Groot et al. 2004).

The competition dynamics in different parts of the world and with multiple stakeholders has shifted the attention from conventional market pull versus technology push dilemma's towards the acceptance of a Triple Helix paradigm, in which the interface between industry, knowledge institutions and governance agencies has become a central field of attention (see Leydesdorff and Etzkowitz, 1998). In this context, new economic analysis frameworks — in particular, endogenous growth (see Aghion, 2002; Lucas, 1988; Nijkamp and Poot 1998; Romer 1990), the new economic geography (Fujita and Krugman, 2004), and evolutionary economics (see e.g. Boschma and Lambooy, 2001; Nelson and Winter, 1982; and Van den Bergh et al. 2007) have highlighted the importance of strategic behavior of economic actors and entrepreneurs at a micro scale on a local or regional level.

Economic analysis of spatial-economic dynamics and innovation has mainly centered around new technological regimes, market regimes and institutional regimes. Far less attention has been given to demographic regimes (see Poot 2007 for an interesting exception). But it ought to be recognized that demographic forces — mainly as a result of international migration — exert a significant impact on economic development and innovative potential of countries and regions. For example, a large share of the innovation success of the USA can be ascribed to the influx of foreigners who created an innovative spirit in an uncertain economic climate.

In an open and globalizing world it seems plausible that international mobility will be on a rising edge, starting from the business, R&D and knowledge sector, but increasingly spreading out to other sectors of the economy (e.g., medical care, consultancy etc.). The entry into the labour market of host countries by foreign workers is often fraught with many problems (due to the existence of language, institutional and cultural barriers), and hence many migrants are stimulated to seek for self-employment. Self-employed migrants are increasingly resorting to so-called ethnic (or migrant) entrepreneurship (see Baycan-Levent et al., 2003 and 2006; Jones and Ram, 2007; Rath, 2000; Stiles and Galbraith, 2004; Waldinger et al., 1990; Ward and Jenkins, 1984). A wealth of scientific contributions and reviews on ethnic entrepreneurship can be found in Dana (2007). Migrant entrepreneurs are typically found in traditional sectors of the urban economy, for instance, in the retail, hospitality and repair sector. But in recent years, we have observed a gradual upgrading of these entrepreneurs towards higher levels, e.g., consultancy, ICT services, legal services and so forth, in particular by second-generation migrant entrepreneurs. This

stepping-stone effect of migrant entrepreneurship will most likely lead to drastic changes in the composition and performance of migrant entrepreneurs. The present study is mainly exploratory in nature and will address the urban growth potential of the next generation of migrant entrepreneurs. Thus, our paper will offer a novel addition to the extant literature on entrepreneurship by migrants by tracing the conditions for business performance.

The present paper aims to address the shift in migrant entrepreneurship towards promising and modern urban economic sectors. It takes for granted the proposition that business involvement in modern or high-tech sectors will prompt an upgrading of migrant entrepreneurs, which may lead to socio-economic emancipation. As an example, we will take the involvement of migrant entrepreneurs in the ICT and the financial services sector in the city of Amsterdam. We will offer an analysis of critical success conditions and barriers for these businesses, based on extensive structured interviews with these entrepreneurs. The — mainly qualitative — information from these interviews will be systematically integrated in a coded nominal (alpha-numerical) survey table, which will be further analyzed by means of a rather novel technique from the artificial intelligence literature, viz. rough set analysis. This exploratory study aims to lay the foundation for a novel analysis of the 'next-gen' growth potential of migrant entrepreneurs in cities. The paper will be concluded with some retrospective and prospective remarks.

2. The Second Cycle in Migrant Entrepreneurship

Europe has become an 'epicentre' of immigration (Van de Kaa, 1996). European cities have demonstrated a remarkable demographic change, with a large influence of foreign migrants in the past decades. Between 1975 and 2000, the population of Europe grew from 349 to 375 million (Brücker et al., 2002). Several districts in European cities have nowadays a majority of foreigners and within two decades several European cities will have a majority of first and second-generation migrants. European cities tend to become cultural melting pots (see Jacobs, 1961).

The influx of many migrants into the urban economies of many European countries has led to a socio-economic differentiation accompanied by persistent disparities on urban labor markets that is mirrored by (i) relatively high unemployment rates of migrants and (ii) a concentration of migrant workers in lower segments of the labor market leading to a dual labor market (see Piore and Sabel, 1984). Many migrants do not appear to meet the requirements for professional human capital in a modern economy and hence are condemned to resort to lower qualified types of jobs. However, next to professional human capital, any developed economy also needs entrepreneurial human capital (see Iyigun and Owen, 1998). However, entrepreneurial spirit is a scarce good that can be acquired by training, education or learning mechanisms through the pressure of economic circumstances (as is also witnessed in the resource dependence theory). There is an abundance of literature on entrepreneurship (see for surveys Audretsch and Thurik, 2001; Hébert and Link, 1989; Lumpkin and Dess, 1996; Wennekers and Thurik, 1999). In general, creativeness, risk-taking behavior, courage, technological and market knowledge as well as human and social skills are usually regarded as necessary background factors for successful entrepreneurship.

In the modern literature on entrepreneurship we sometimes come across the term 'entrepreneurial hero', suggesting that successful entrepreneurial behavior presupposes jumps leading to high performance. However, some realism is needed here, as most business innovations are incremental in nature (see Kassichieh et al., 2002). In many cases, successful business-making is only based on variational imitation, where certain products or services in a new domain are offered as a variant to a new or existing product or service (see Iyigun and Owen, 1998). Thus, one may acquire that incremental innovations are mainly taking place under conditions of monopolistic competition. It is obvious that risk attitudes and avoidance are key ingredients of an entrepreneurship culture present on a monopolistic competition market (Hofstede, 1991).

Many migrant entrepreneurs have their roots in a local, small-scale and network-based culture — and are thus dependent on socio-cultural urban incubation climate — and will often be inclined to start up a new business from a risk-avoiding attitude (see e.g. the mixed embeddedness perspective, advocated by Kloosterman and Rath 2001). This explains their presence in traditional markets where there is still a sufficient critical mass of demand for indigenous ethnic products or services, without a requirement for knowledge-intensive products or services (the 'pizza' phenomenon). But with mass competition and the introduction of new products — and thus more market opportunities — there will be a trend towards new and more promising SME market niches, especially by second-generation migrants (see also Cooper, 2003; Malecki, 1997).

Consequently, we observe the emergence of a second cycle where migrant entrepreneurs penetrate increasingly a new knowledge-intensive product or service market. This requires an upscaling of human capital, with more competition outside the traditional ethnic domain. This prompts diversity in the supply of products and services and leads to more competitive marketing actions. This transition will also challenge the traditional network cooperation model of migrant entrepreneurs in their own ethnic or socio-cultural niche. Simultaneous competition and cooperation will become the new features of the markets for migrant entrepreneurs, where local embeddedness and sector-specific innovative cultures are key ingredients (see Markusen 1996). This emerging case of monopolistic competition is already visible in new knowledge-intensive fields like ICT, consultancy, export services, marketing etc. It may seem realistic that this second phase of knowledge-intensive entrepreneurship may pave the road towards the final stage of mature entrepreneurship, viz. a break-out towards entirely new and modern markets.

In the sequel of this paper, we will investigate the second cycle of migrant entrepreneurship in the ICT and the financial services sector in Amsterdam. The next section will be devoted to an overview of migrants and entrepreneurship in the Netherlands.

3. Migrants and Entrepreneurship in the Netherlands

3.1. Migration and immigrants: the case of the Netherlands

The Netherlands has a long international and national migration history (see for a discussion of immigration flows in different periods Kraal and Zorlu, 1998; Lucassen and Penninx, 1997; Zorlu and

Hartog, 2001). In the post-War period, political processes and economic developments determined migration to the Netherlands and the country switched from an emigration into an immigration country. By the mid-1950s, the Dutch economy began to grow and this led to a labor shortage of unskilled workers in certain sectors, such as industry and mining. The demand for workers for unskilled jobs increased, while the supply of unskilled Dutch workers was decreasing. The shortage of unskilled workers was compensated by an inflow of Mediterranean workers (Hartog and Vriend, 1990). Guest workers were actively recruited from Mediterranean countries; Italy, Spain, Portugal, Turkey, Greece, Morocco, Yugoslavia, and Tunisia. The recruitment policy stopped during the first oil crisis, but the immigration from the recruitment countries continued as chain-migration in the form of family reunification (1970s) and family formation (1980s and 1990s). In addition, the flow of political refugees and asylum seekers, from politically unstable areas in the world, also increased in this period. Therefore, in only three decades, the non-Western population grew from 160,000 in 1972, to 1.7 million in 2004 (Tillie and Slijper, 2006). Ultimately, Surinamese, Antilleans, Turks, and Moroccans became the largest migrant minority groups, and this group is gradually growing as a result to a combination of continuous immigration and a relatively high birth rate. Nevertheless, immigration streams are now increasingly dominated by political refugees and asylum seekers.

Figure 1 about here

In the past three decades, non-Western immigrants were responsible for half of the population growth in the Netherlands (Garssen and Zorlu, 2005) and the increase of non-Western immigrants is partially caused by the growing share of second-generation immigrants. According to the latest data of CBS (2007), in the last ten years, since 1996, the sharpest rise in the absolute number of second-generation immigrants was amongst Moroccans with 70,219, followed by Turks with 64,356 second-generation immigrants (see Figure 1).

This increase in the number of first and second generation non-Western immigrants in the Netherlands gained increased attention to socio-cultural position and structural integration of immigrants (see Bijl et al., 2005; Dagevos et al., 2003). The socio-economic characteristics of migrants living in the Netherlands can be summarized by the following stylized facts: migrants are younger than natives, the proportion of males is higher in the migrant population than in the native population, migrants are concentrated in large cities; Rotterdam, Amsterdam, The Hague and Utrecht, the skill levels of migrants may be below those of the native population, and their occupational status is below those of natives with comparable skill levels. Finally, migrants are more than proportionally affected by unemployment (Brücker et al., 2002). However, a comparative evaluation between the first and the second generation within the different immigrant groups shows that the level of education differs considerably between the first- and the second-generation immigrants. The first-generation immigrants have a lower level of education compared with the Dutch natives, whereas the second-generation immigrants do not differ significantly from the Dutch natives (Zorlu and Traag, 2005). Depending on their better educational level, the second-generation immigrants in general have a better position in the labor market than the first generation. However, in

2004, after years of economic recession, the labor market participation of immigrants decreased to 48 percent, and the unemployment rate was 16 percent among immigrants, three times higher compared with that of the native Dutch (Zorlu and Traag, 2005). This led to increasing numbers of first- and second-generation immigrants choosing to become self-employed.

After this historical overview of immigration and the current situation of immigrants in the Netherlands, we will discuss in the next section the labor market position of different migrant groups and migrant entrepreneurship in the Netherlands.

3.2. Migrant entrepreneurship in the Netherlands

Since the late 1980s, the number of immigrant entrepreneurs has risen sharply in the Netherlands. While the total number of entrepreneurs increased from 925,800 to 939,799 between 1999 and 2004 (Table 1), the highest increase was among non-Western immigrants, compared with native and Western entrepreneurs. The number of non-Western entrepreneurs increased from 34,100 in 1999 to 46,900 in 2004, an increase of 3.8 percent. Amongst Western immigrants the number of entrepreneurs increased from 72,700 to 74,500 (0.2 percent) and amongst the native Dutch the number of entrepreneurs decreased from 819,000 in 1999 to 818,300 in 2004. A decrease in the number of native Dutch entrepreneurs is especially observed after 2001. On the other hand, a decrease in the number of Western entrepreneurs after 2003 also draws attention. So, it seems that, while there is an increasing trend to become an entrepreneur among non-Western immigrants, there is a decreasing trend to become an entrepreneur amongst Western immigrants and the native Dutch. This fact can be partially explained by the recession in the Dutch economy after 2001.

Table 1 about here

Amongst non-Western immigrant entrepreneurs, the highest increase in the number of entrepreneurs was amongst the second-generation immigrant entrepreneurs between 1999 and 2004. While the rate of increase for the first generation was 3.3 percent, it was 7.4 percent for the second generation. However, amongst both the first- and the second-generation non-Western immigrants the self-employment rate lags behind both Western immigrants, as well as the native Dutch (Bijl et al., 2005). While amongst the native Dutch 9.2 percent of the labor force chose to become an entrepreneur in this period, amongst the non-Western immigrants this percentage was 4.1 percent. Nevertheless, between 1999 and 2003 the self-employment rate of non-Western immigrants increased more rapidly than among native Dutch and Western immigrants. In absolute numbers the largest group of immigrant entrepreneurs in the Netherlands, from both the first and the second generation, originate from Turkey and Surinam (Table 2). However, in the period 1999-2004 the sharpest rise was among Moroccan entrepreneurs: namely, 64 percent.

Table 2 about here

There are considerable differences in the self-employment rates among the different ethnic groups. First-generation Chinese immigrants are most active as entrepreneurs in comparison with the other ethnic groups. Furthermore, Chinese immigrants choose to become an entrepreneur almost twice as often as the native Dutch (Bijl et al., 2005). On the other hand, the relative growth of the self-employment rate is higher for Turkish immigrants than it is for Chinese immigrants.

With regard to the sectors in which immigrant entrepreneurs set up their businesses, it appears that, in the past decade, immigrants have more often set up businesses in sectors other than the traditional ones (EIM, 2004; CBS, 2007). Although the hotel and catering industry is still most popular with the first generation, the percentage choosing to set up business in this industry has declined considerably. Instead, the first generation prefers more often to become active as entrepreneurs in other sectors like the business or producer services sectors which include finance, insurance, real estate and business related professional services, such as accounting, consulting, marketing, engineering, or design, most of which provide a high quotient of technical, professional and managerial jobs. The second generation is predominantly represented in the producer services sector. In 2002, one-quarter of the second generation started a business in this sector. As a result, the sectoral distribution of the second generation has become more similar to the native Dutch entrepreneurs than the first generation.

According to the study of Dagevos and Gesthuizen (2005), Surinamese and Antillean entrepreneurs are more often active in producer services than other ethnic groups (Table 3). Among Turkish entrepreneurs there is also an above-average increase of entrepreneurs in the producer services.

Table 3 about here

The research study on first- and second-generation immigrant entrepreneurs in Dutch cities conducted by Rusinovic in 2006 also shows some interesting results about the differences between the first- and the second-generation immigrant entrepreneurs. According to the results of this research, which consists of 252 immigrant entrepreneurs in the Netherlands, the first generation the largest group (31 percent) is active in an ethnic market, whereas amongst the second generation this percentage has declined to 15 percent. The first generation is more often embedded in ethnic markets and depends more than the second generation on informal as well as on transnational networks in running their businesses. Compared with the first generation, the second generation is more often embedded in mainstream markets (38 percent) and almost three-quarters of the second generation are at least partially embedded in formal networks. However, Rusinovic has mentioned that this does not mean that the importance of embeddedness in informal networks has disappeared with successive generations. For the second generation entrepreneurs embeddedness in formal and informal social networks are not mutually exclusive options, but the formal and informal networks overlap or complement each other. The results of Rusinovic's research also show that the embeddedness in transnational networks still remains of importance for the second generation, but the transnational involvement of the second generation has

declined compared with that of the first generation. According to Rusinovic, for the second generation transnational involvement has become more a strategic choice – ‘strategic transnationalism’ – whereas for the first generation it is more often a necessity.

Is the Netherlands offering a solid basis for comparative migrant entrepreneurship research? Although many European countries are facing mass immigration flows, the Netherlands has been one of the first recipients where foreign migrants could enter rather freely, given the tolerant political character of the country. Under such conditions, new forms of entrepreneurship may likely flourish, especially of the first transition problems are overcome. The Dutch situation is not entirely typical of European entrepreneurship conditions, but it offers new insight from a country where openness and entrepreneurship has always been regarded as an asset.

An overall evaluation of immigrant entrepreneurship in the Netherlands highlights the changing trends in recent years. The new trends have emerged as: i) a new orientation to non-traditional sectors; ii) sectoral change in immigrant entrepreneurship especially towards producer services; and, iii) an increasing number of second-generation immigrant entrepreneurs. In the sequel of this paper, we will investigate the critical success conditions (and failure conditions) that are decisive for the economic performance of migrant entrepreneurs in the ICT and the FIRE sector in Amsterdam (see also van Oort and Atzema 2004). The ICT market is seen here as a new market (second cycle) for innovative migrant entrepreneurs. The next section will be devoted to a concise description of our database.

4. Turkish Entrepreneurs in the ICT and the FIRE Sector in Amsterdam: Profile and Data Base

4.1. A sketch of Turkish entrepreneurship in the Netherlands

The first wave of Turkish immigration to the Netherlands took place in the 1960s and 1970s. The shortage of unskilled laborers led the Dutch government to sign a treaty with the Turkish government for the immigration of what are known as ‘guest laborers’. According to Dieleman (1993), many immigrants came to the Netherlands in the 1960s and 1970s to work in the old industries. Dutch companies recruited these people for heavy, unskilled work (Houtzager and Rodrigues, 2002). As elsewhere, they filled the demand for workers at the bottom of the job market. The Netherlands went through a long period of economic growth during these years, and the number of Turkish immigrants grew strongly. The first oil crisis was the end of the official recruitment of Turkish guest workers, and the number of entrants decreased. The occurrence of the second oil crisis caused an economic crisis and a decrease in the demand for workers. Long-term unemployment became a serious problem. After this period, migration from Turkey almost solely consisted of family reunification (bringing wife and children to the Netherlands), family formation (bringing in a marriage partner from their country of origin), and asylum migration. At first, both the Turkish guest workers and the Dutch government thought their stay would be temporary. After a brief working period, they planned to return to their home country with the savings in the Netherlands. Nevertheless, most of the Turkish guest workers decided to stay and then brought their wives and children

to the Netherlands. Many people came to the country because of this family reunification and the Turks became permanent habitants of the Netherlands. As the economic crisis hit the Dutch economy in the 1970s, especially the old industries, many immigrants were faced with exclusion from new job opportunities in the restructured urban economy (e.g. in the services sector), and a number of them tried to make a niche as small business entrepreneurs.

Nowadays, the Turks are the major immigrant group in the country. In 2004, about 350,000 first- and second-generation Turks lived in the Netherlands, which is about 2.2 percent of the Dutch population (Euwals et al. 2007). Turkish immigrants in the Netherlands are on average younger than the native Dutch population; they often have more children; and usually they have a lower level of education. Their participation in the labor market lags significantly behind that of the native Dutch population in the Netherlands. The employment rate for Turkish men is 23 percent points lower than it is for native men (Euwals et al., 2007). The relatively low level of education of Turkish immigrants in the Netherlands may be a reason for the less favorable labor market position of Turkish immigrants in the Netherlands.

Choenni (1997) noted that more than 10 percent of the Turkish working population in Amsterdam consists of entrepreneurs, and they constitute about 20 percent of all ethnic entrepreneurs in Amsterdam. The hospitality sector (restaurants, cafés, bars) is an important domain for Turkish entrepreneurs. Recent research indicates that, in relation to the total population, Turkish entrepreneurs account for the highest percentage of start-ups amongst all groups (including the native Dutch) in the Netherlands: 11.5 percent of the Turkish working population started their own firm in 2000, versus 6.5 percent of all other groups (www.kvk.nl). Jansen et al. (2003) mentioned that, despite certain disadvantages compared with the native Dutch population, immigrants from Turkey show the same rate of entrepreneurship. Although the Turkish immigrants show similar characteristics to other immigrants (from Morocco, Suriname and the Antilles), their rate of entrepreneurship is much higher. According to Masurel and Nijkamp (2004), Turkish entrepreneurs account for the highest percentage of start-ups amongst all groups, in relation to the total population (including the Dutch native population).

Today, Turks are the largest entrepreneurial group in the country. Furthermore, the relative growth of the entrepreneurship rate is higher among Turkish immigrants, in relation to other non-western groups. Between 1999 and 2004 the total number of Turkish entrepreneurs in the Netherlands increased from 7,900 to 11,700 (see Table 4). Among Turkish immigrant entrepreneurs there is an increasing group second-generation immigrants. In 1999, out of the 7,900 Turkish entrepreneurs, 800 were of second-generation whereas in 2004 out of the 11,700 Turkish entrepreneurs, 1,800 were of second-generation immigrant entrepreneurs. While rate of increase for the first generation was 1.4 percent, it was 2.3 percent for the second generation.

Table 4 about here

Most Turkish entrepreneurs work in the hospitality sector (bars, cafes, restaurants), but nowadays, we can see a shift to different sectors. According to Dagevos and Gesthuizen (2005), there is an above-average increase of entrepreneurs in the producer services (finance, insurance, real-estate, and

business- related professional services). Therefore, the next section will investigate the motivation, driving forces, goals and strategies of Turkish entrepreneurs in these new sectors.

4.2. Profile of Turkish entrepreneurs in the ICT and the FIRE sector

In our study we aim to explain the qualitative performance or output indicators of Turkish entrepreneurs in the ICT and the financial services sector in the city of Amsterdam. The sample of our study consists of a total of 23 Turkish entrepreneurs of whom 16 are active in the ICT sector and 7 are active in the FIRE sector. Clearly, this is not a large sample. But the number of Turkish firms in the upcoming ICT and FIRE market is still relatively small, while various Turkish businessmen did not want to participate in an interview because of fear of disclosure of confidential information. Thus, the present sample was the most reasonable set that could be found with a reasonable effort under the present conditions. But the information obtained during the interviews was based on trust and uncovered many interesting details. It was also felt that a desperate search for more candidate-interviewees would not bring about additional new information. Our sample considers three groups of companies/entrepreneurs in the ICT sector: automation; software computer programming and Internet service provider companies, and in the FIRE sector: finance, insurance, real estate, consulting and accountancy companies that require a higher educational level and skills and that are very far from any ethnic niche in terms of products, services and communication channels. The empirical data of our research are based on in-depth personal interviews held in the first half of 2007. Much information about the entrepreneurs was provided first from the Turkish businesses website "Webisrehberi" for the contact addresses and then during the survey in an informal way using both the ethnic and business networks and personal contacts with entrepreneurs. The interviews were held on a personal basis, by a bilingual (Turkish and Dutch speaking) interviewer, which created a confidence from the side of the interviewee. The interviewees could sometimes take more than an hour. Sufficient consideration was given to the credibility, transferability and dependability of the research (Guba and Lincoln, 1989).

In the present section we examine the profile of the Turkish entrepreneurs in the ICT and FIRE sector in terms of personal characteristics, motivation, driving force and entrepreneurial family tradition. An examination of the personal characteristics of Turkish entrepreneurs in the ICT and the FIRE sector shows that the majority of the entrepreneurs (74 percent) fall between the age 30 and 49. When the arrival year is taken into consideration we see that more than half of the entrepreneurs (52 percent) came between 1971 and 1980 (when they were younger than 12 years old), whereas 22 percent were born in the Netherlands. Therefore, the majority (74 percent) of the entrepreneurs fall in the category of the second-generation with their educational attainment (83 percent) achieved in the Netherlands. While the majority (56 percent) graduated from middle and higher vocational schools, the rest (35 percent) graduated from universities. Depending on their arrival year and educational attainment in the Netherlands, all of them can speak Dutch fluently or quite well and most of them (83 percent) can also speak English fluently or quite as well. An overall evaluation of personal characteristics of the second-

generation Turkish entrepreneurs draws attention to their higher educational level and language ability (see Table 5).

Table 5 about here

When we look at the labor market position, the previous experience and the previous sector of Turkish entrepreneurs before the start of their present business (Table 5), we see that the majority (78 percent) of the entrepreneurs were employed and 9 percent were already active as an entrepreneur in their previous labor market position. While, in general, unemployment is observed as a driving force to become entrepreneur for many immigrants, in our case unemployment was not found to be a driving force. On the contrary, it seems there is a pulling-effect to become an entrepreneur as a result of previous experience of being entrepreneurs through employment and/or entrepreneurship, and moreover the actual way that this experience was obtained as an employee and entrepreneur in the same sector (69 percent). The sector choice of entrepreneurs also supports this pulling effect. Almost 40 percent of the entrepreneurs have oriented to this sector because of the high demand or the gap in the sector whereas the other 40 percent of the entrepreneurs have chosen this sector because of their work experience and 20 percent because of their education. The current situation of the sector was evaluated by the majority of the entrepreneurs (52 percent) as a growing sector, while emphasizing the existence of a lot of changes, as well as intense competition in the sector. This growing and promising sector structure can be another pull-effect for entrepreneurs. The existence of Turkish entrepreneurs in the same sector does not show clear evidence of the attractiveness of this sector for entrepreneurs: 48 percent of the entrepreneurs mentioned that the share of Turks in the sector is decreasing, while 30 percent claimed, on the contrary, that the share of Turks is increasing.

When we look at the reasons to become an entrepreneur, the first reason appears as 'to be independent' and 'to be one's own boss' (78 percent). 'Flexibility' with a share of 13 percent ranks as the second reason. It seems that to have an extra income is not an important reason to become an entrepreneur. While more than half of the entrepreneurs (52 percent) have an entrepreneur family member, which could be evaluated as another motivation or driving force to become entrepreneur, the other factors such as capital sources and information sources show that entrepreneurs are not dependent on their family or friends. 74 percent of the entrepreneurs have used their own capital and 61 percent used their own experience (see Table 5). All these figures clearly show that the second-generation Turkish entrepreneurs are quite independent of their ethnic niche.

4.3. Profile of Turkish enterprises in the ICT and the FIRE sector

In this section, we examine the profile of Turkish enterprises in the ICT and the FIRE sector in terms of enterprise features, performance, profiles of employees and clients and goals and strategies. Turkish enterprises in our case study are in two sectors: the ICT sector which consists of three groups of companies/entrepreneurs viz. automation companies; software computer programming companies; and

Internet service provider companies and the FIRE sector which consists of finance, insurance, real estate, consulting and accountancy companies (Table 6). However, the majority of the enterprises (70 percent) in our sample are in the ICT sector. When we examine the features of the enterprises we observe that the second-generation Turkish entrepreneurship started after 1996, and there is an enormous increase in start-up enterprises especially after 2000. More than half of the enterprises (57 percent) in our sample have started after 2000. Most of the enterprises are small whereas the majority (61 percent) has less than five workers.

Table 6 about here

When the development of sales and the profit of the previous year are examined for Turkish enterprises in the ICT and the FIRE sectors as of their performance, 91 percent of the enterprises had an increase in sales, while the rest 9 percent had about the same level (Table 6). The profit of the previous year shows the same success level, while 87 percent of the entrepreneurs had a positive profit, 13 percent had the same profit. There has been no decrease in the development of sales and no negative profit at all. These figures show a very high economic performance.

When we examine the number and the composition of employees, we see that 23 Turkish enterprises in the ICT and the FIRE sectors provide an employment opportunity for 111 persons of whom 64 percent are from their own ethnic group (Table 6). Although Turkish entrepreneurs have an independent profile on the basis of motivation and driving forces, as well as capital and information sources, here interestingly we observe a relatively high dependency on the entrepreneurs' own ethnic group in terms of hiring employees. While 22 percent of the entrepreneurs explained that they needed to have Turkish employees because of their Turkish clients, 13 percent clearly mentioned that they prefer Turkish employees for many other reasons. Nevertheless, more than half of the entrepreneurs (57 percent) mentioned that they actually preferred to hire Dutch employees.

These figures show that the highest dependency on the entrepreneurs' own ethnic group when compared with the other factors is shown by the composition of employees. However, some of these figures can also be evaluated as a sign of transformation from the entrepreneurs' own ethnic group to other groups when hiring employees. On the other hand, when we examine the composition of the clients, we observe that 35 percent of the enterprises have non-Turkish clients, while almost 40 percent have a mixed clientele with a majority (80 percent) of Turkish clients. Although the majority of the enterprises serve non-Turkish clients, the share of Turkish clients is quite high, and here we observe once more a dependency on the entrepreneurs' own ethnic group.

When we examine the target groups of the enterprises as a part of their goals and strategies, we observe once more a relatively high dependency on clients from the entrepreneurs' own ethnic group. 35 percent of the entrepreneurs have indicated that their target group is Turks (Table 6). 35 percent of the entrepreneurs mentioned that they had no target group, while 22 percent mentioned that their target group is Dutch natives and other groups. On the other hand, the stated strategies of the majority (57 percent)

were to grow the business and to provide more products and services. Specialization was another strategy for 30 percent of the enterprises.

An overall evaluation of the profile of Turkish entrepreneurs and enterprises in the ICT and the FIRE sector shows that the second-generation Turkish entrepreneurship in the Netherlands started after 1996, and there has been an enormous increase in start-up enterprises especially after 2000. Depending on the arrival year of the Turkish immigrants in the Netherlands, we may expect this increase in start-up second-generation enterprises to continue in the future. We may also expect that the sector choice of the second generation Turkish entrepreneurs will be different from that of the first generation, and will probably be more oriented to non-traditional, new developing and promising sectors such as ICT, FIRE or maybe to the education and health sectors where nowadays in many European countries immigrant employment is becoming increasingly significant (between 20 and 30 percent of immigrants work in one of these two sectors in Finland, Switzerland, Sweden and the UK (OECD, 2006)).

The results of our investigation demonstrate that the motivation and driving forces of the second-generation Turkish entrepreneurs stem from both their personal characteristics, shaped by their higher educational level and language ability, and their previous working experience as an employee or entrepreneur in the same sector. The demand for, and a gap in, the sector, as well as the growing and promising structure of the sector seem to play an important role in pulling the second-generation Turkish immigrants to become entrepreneurs. In summary, we can say that the motivation and driving forces of the second-generation Turkish immigrants can be explained by the pull factors. While their main motivation to become entrepreneurs appears to be independent and flexible, the other reason could be that they possess an entrepreneurial spirit which comes from entrepreneurial family tradition, as more than half of the entrepreneurs have an entrepreneur family member.

The results of our study show that the second-generation Turkish entrepreneurs are quite independent on their own ethnic group in terms of obtaining capital and information. They tend to use their own capital and own knowledge and experience and when necessary they tend to apply to formal and financial institutions. We can say that their approach and behaviour is different from their first generation counterparts: it is more formal. This clearly shows that the second-generation Turkish entrepreneurs are quite independent from their ethnic niche. However, when the number and the composition of employees and clients are examined, this picture changes slightly. Although the second-generation Turkish entrepreneurs exhibit an independent profile on the basis of motivation and driving forces, as well as capital and information sources, it is noticeable that there is still a relatively high dependency on their own ethnic group in terms of hiring employees and serving clients. Their relatively higher rate of having Turkish clients as a target group also highlights a relatively high dependency on clients from their own ethnic group. They adopt this strategy in order to benefit from both their own ethnic group and the other groups in the market. Why would they wish to escape from potential and available clients from their own ethnic group? From this perspective, a relatively higher level of employees and clients cannot be seen as an ethnic dependency. On the contrary, this can be evaluated as a way of expanding the market and a transformation period from an internal orientation to an external orientation.

5. Key Factors of Entrepreneurial Performance among Turkish Enterprises in the ICT and the FIRE Sector

In this section, we will analyze in more detail the most prominent key factors of entrepreneurial performance among Turkish enterprises in the ICT and the FIRE sector by using a multivariate qualitative classification method, coined rough set analysis. We will first explain rough set analysis that originates from the artificial intelligence methodology. Then in the next section we will evaluate the empirical results of the rough set analysis that enable us to identify the new orientations in migrant entrepreneurship in terms of motivation, sectoral choice, goals and strategies of second generation migrant entrepreneurs.

5.1. Rough set analysis: an introduction

The rough set theory developed by Pawlak (1991) has emerged as a major mathematical method to manage uncertainties from inexact, noisy and incomplete information. The applications of rough set theory to solving specific complex problems have been an attractive research topic in recent years and a large number of rough set theory applications has been reported in various fields such as medicine, economics, finance, business, environmental engineering, intelligent control, signal and image analysis, software engineering, decision analysis, social sciences, molecular biology and pharmacy (see for a comprehensive review of the available literature on applications of the rough set theory Wu et al., 2004). Rough set theory is an extension of set theory; it can effectively handle discrete variables with multilevel categories. A rough set provides a representation of a given set using lower and upper approximations when the available information is not sufficient for determining the exact value of the set. The main objective of rough set analysis is to synthesize the approximation of concepts from the acquired data. It is non-parametric and instead of null hypothesis of significance testing, rough set theory provides an alternative way to evaluate the importance of factors. Furthermore, rough set theory can classify cases into groups with similar properties by considering multiple dimensions that help reduce the unobserved heterogeneity.

Rough set data analysis (RSDA) is a classification method for the analysis and classification of non-stochastic (including qualitative and nominal) information. RSDA is an application of Knowledge Discovery in Databases which is concerned with extracting useful information from a complex multivariate data base (Fayyad et al., 1996). The rough set methodology for knowledge discovery provides a powerful tool for knowledge discovery from large and incomplete data set. The purpose of rough set is to find models that describe or classify measurement data. This task falls into an extensive category of pattern recognition, which, broadly speaking, can be said to be the science of constructing models that describe or classify measurements. Rough set data analysis is based on minimal model assumptions in terms of formal causal specifications and admits ignorance when no proper conclusion can be drawn from the data at hand (Ziarco, 1998). Hence, it is more exploratory and heuristic in nature, and aims to generate conditional statements on classified data. It is particularly suitable for qualitative multi-dimensional case

study research, where the aim is more to highlight salient features in causal pattern recognition than to extract representative statistical outcomes.

RSDA draws all its information from the a priori given data set. In RSDA, there is no numerical system that is different from the operationalisation of the observed data, and there are no outside parameters to be chosen, nor is there any deductive statistical model to be fitted. RSDA can be viewed as a preprocessing device to recognize the potentially important explanatory variables. Data reduction is the main feature of RSDA, as it allows to represent hidden structures in the database. The final outcome of the data base is a decision table from which decision rules can be inferred by using rough set analysis. The rules are logical statements (if...then) which represent the relationship between the description of objects and their assignment to particular classes (see Pawlak 1991; 1992). Details on rough set analysis both from a methodological and from an applied perspective can inter alia be found in Degoun et al., 1997; Famili et al., 1997; Fayyad et al., 1996; Pawlak, 1991, 1992; Slowinski, 1995; van den Bergh et al., 1998; Wu et al., 2004 and Ziarno, 1998. The reader is referred to these studies for more details.

The rough set analysis in our study is carried out with the help of the computer program Rough Set Data Explorer (ROSE). We use the ROSE software here to identify the new orientations in migrant entrepreneurship in terms of motivation, sectoral choice, goals and strategies. The rough set theory allows us to analyze the new orientations in multiple dimensions and to highlight the most prominent factors behind the new sectors in our case ICT and FIRE sector and sectoral choice of migrant entrepreneurs. In our study, the data system on Turkish entrepreneurs in ICT and FIRE sector is often of a categorical nature, for instance, nominal data (e.g., generation, education etc.) or ordinal (e.g., rank order data on age categories etc.) therefore it is suitable for classification and explanation. Rough set analysis acts then as a specific multidimensional classification approach that appears to be able to identify various important factors in orientation of migrant entrepreneurs. In the next sub-section, we will describe in some more detail the data base used in our study.

5.2. Results of rough set analysis

The application of rough set analysis proceeds in two successive steps; (i) the construction of an information survey, and (ii) the classification of information contained in the survey. In our case, the information survey consists of entrepreneurial characteristics of migrant entrepreneurs in terms of their motivation and orientation (Table 7). As can be seen in Table 7, our rough set framework consists of 17 variables under three categories viz. *personal characteristics* (e.g., age, generation, education level), *motivation and driving forces* (e.g., position before start, previous experience, entrepreneur family member) and *orientation* (e.g., nationality of employees, nationality of clients, target group). In our rough set framework we used all variables as conditional attributes and two variables including A8(D2) sectoral choice and A17(D1) sector as decision attributes as well. Therefore, we deployed the rough set analysis separately for both the sector and sectoral choice as decision variables to highlight the characteristics of

the sectors (ICT and FIRE) investigated and the factors which are determinant in sectoral choice and orientation of migrant entrepreneurs.

Table 7 about here

The next step, the classification of information contained in the survey, is one of the most problematic issues in the application of rough set analysis, as the chosen thresholds are not always unambiguous and hence may also lead to information loss. In general, some sensitivity analysis on the classification used is meaningful, as a balance needs to be found between homogeneity and class size. In our case, after some sensitivity analyses the categories for each relevant attribute are defined and listed in Table 7. Next, on the basis of these categories, the resulting coded information table is constructed for Turkish entrepreneurs in ICT and FIRE sectors (see Table 8).

Table 8 about here

In the technical application of the rough set analysis, three main sets of indicators and outputs, viz. (i) the reducts and the core, (ii) the lower and upper approximation, and (iii) rules, can next be calculated.

1. The reduct -in other words, a minimal set of attributes- is the least minimal subset which ensures the same quality of classification as the set of all attributes. Intersection of all reducts/minimal (in other words, an attribute that appears in all minimal sets) is defined as the core. The core is a collection of the most significant attributes for the classification in the system. For our data set, no core attribute is found and with a limitation on the number - in order to get the more concise results - ten sets of reducts are found for sector and sectoral choice of migrant entrepreneurs. The reducts for each set of data on the basis of the decision variable for sector and sectoral choice are given in Table 9. Next, the relative frequencies of appearance of the condition attributes in the reducts for each data set are given in Table 10.

Table 9 about here

Table 10 about here

When we examine the relative frequencies of appearance of the condition attributes in reducts for sector and sectoral choice, the results show that three factors/attributes viz. *A13 (nationality of employees)*, *A14 (preferences for employees)* and *A16 (target group)* appear as relatively important attributes with higher frequency rates. This means that these attributes strongly influence the sector structure and sectoral choice of Turkish entrepreneurs.

2. The lower and upper approximation -and derived accuracy of relationships for each value class of the decisional variable- is another indicator from a rough set analysis. The latter is the lower divided by

the upper approximation of each class. Accuracy and quality of classification can also be derived from the choice of thresholds. Accuracy and quality of the classification for sector and sectoral choice are given in Table 11. For all classes of sector and sectoral choice the accuracy appears to be 1. Also the accuracy and quality of classification are equal to 1. This value is the maximum value in all these cases. This means on the basis of the chosen sector and sectoral choice variables in our sample are fully discernible regarding the classes of decision variables.

Table 11 about here

3. The rules -exact or approximate relationships between explanatory variables and dependent variables- offer the possibilities to extract conditional causal structures from our data set. Decision rules are conditional statements that are expressed in the form of “if-then” statements. A rule may be exact or approximate. An exact rule (or deterministic) guarantees that a particular combination of categories of the condition attributes results in only one particular category of the decision attribute (same conditions, same decisions). An approximate rule (or non-deterministic), on the other hand, states that a particular combination of categories of the condition attributes corresponds to more than one category of the decision attribute (same conditions, different decisions). Therefore, only in the case of exact rules, using the information contained in the decision table, it is always possible to state with certainty whether an object belongs to a certain class of the decision variable. The quality of the decision rule is indicated by its strength. The strength of a rule represents the number of observations or cases that are in accordance with that rule. Table 12 shows the rules and their strengths that can be generated from our data set for Turkish entrepreneurs. We only use the rules with strength of three or more. This means that the relation described in the rule appears at least three times in the data set, but in some cases it also appears eight or nine times. Therefore, we selected the most significant rules which have a higher strength that means the number of cases matching the rule. This information enables us to classify the important factors behind the orientation and sectoral choice of migrant entrepreneurs.

Table 12 about here

Table 13 describes the significant rules and the most important factors behind orientation and sectoral choice of Turkish entrepreneurs. The results of the rough set analysis show that while “*working experience as an employee in the same sector*” and “*educational attainment*” lead to orient the second generation Turkish entrepreneurs to the ICT sector, “*a perceived demand for the sector*”, “*the increasing number of Turks in the sector*” as well as “*potential Turkish clients*” attract the second generation Turkish entrepreneurs to the FIRE sector. “*Age*” appears as another important factor in the ICT sector, while relatively older entrepreneurs are motivated by their own experience, the youngest entrepreneurs are more motivated by an entrepreneurial family tradition.

The results of the rough set analysis show also that while *“entrepreneurial experience in a different sector”*, *“own information and experience”* and *“Turkish clients”* appear as important factors in perceiving a gap in or a demand for the sector and determine the sectoral choice on the basis of demand, *“educational opportunities in the Netherlands”*, *“higher educational level”*, *“experience as employed”* and related to this educational background having *“preferences for Dutch employees”* constitute the main factors behind a sectoral choice on the basis of education and experience. This educational and working experience lead Turkish entrepreneurs to be active in the ICT sector.

Table 13 about here

The most important factors in motivation, driving forces and sectoral choice of the second-generation Turkish entrepreneurs in the ICT and the FIRE sector in the Netherlands emerged in three factors/attributes: (i) nationality of employees; (ii) preferences for employees, and (iii) target group (see Table 14). Our evaluation clearly shows that there are some differences in orientation to the ICT and the FIRE sectors. While the existence of both Turkish entrepreneurs in the sector and potential Turkish clients, as a result a perceived demand for the sector constitute the determinant factors behind the choice for the FIRE sector, educational attainment and working experience appear as determinant factors towards orientation to the ICT sector (see Table 15).

Table 14 about here

Table 15 about here

6. Retrospect and Prospect

A growing number of the second generation migrant entrepreneurs and an orientation to non-traditional sectors have become the new trends in migrant entrepreneurship in recent years. The second generation have contributed to the emergence of new areas of immigrant business activity such as ICT and creative industries. Similar trends, a sectoral change in immigrant entrepreneurship towards especially to producer services and an increasing number of second generation immigrant entrepreneurs in these sectors, are also observed in the Netherlands.

Our study investigated the new –external- orientations in migrant entrepreneurship in terms of motivation, sectoral choice, goals and strategies of the second generation migrant entrepreneurs while addressing the second generation Turkish entrepreneurs in the ICT and the FIRE sector in the Netherlands. The results of our investigation show that a new orientation to the non-traditional sector or in other words, an external orientation with a combination of personal characteristics, skills and experience may produce a very high economic performance and success level of the second-generation Turkish entrepreneurs. Therefore, this new orientation may also help them to escape from the ethnic enclave and

break out from their ethnic dependency. Moreover, this external orientation may also help them to expand their market. However, this external orientation does not mean that they will not also continue to benefit from their own ethnic group. The results of our study show that the motivation and driving forces of the second generation Turkish entrepreneurs are stemming from both their personal characteristics shaped by their higher educational level and their previous working experience as an employee or entrepreneur in the same sector. The demand for and a gap in the sector as well as the growing and promising structure of the sector play also an important role in pulling the second generation Turkish immigrants to become entrepreneur in these new sectors.

The results of our study by means of the rough set analysis show that the most important factors in motivation, driving forces and sectoral choice of the second generation Turkish entrepreneurs in the ICT and FIRE sector in the Netherlands have emerged in three factors/attributes:

- Nationality of employees
- Preferences for employees
- Target group

The results of the rough set analysis show also that there are some differences in orientation to the ICT and the FIRE sectors. While educational attainment and working experience appear as determinant factors towards orientation to the ICT sector, the existence of both Turkish entrepreneurs in the sector and potential Turkish clients, as a result a perceived demand for the sector constitute the determinant factors behind the choice for the FIRE sector. An overall evaluation shows that Turkish entrepreneurs in the ICT sector exhibit a more independent feature than that in the FIRE sector. FIRE sector seems to be more dependent to ethnic market and ethnic niche. However, the general results of our study show that the second generation Turkish entrepreneurs in the Netherlands have started to orient to new and non-traditional sectors like ICT and FIRE sectors instead of staying in traditional hospitality sector which is popular among Turkish entrepreneurs.

Our findings brought to light new patterns in business performance of ethnic entrepreneurs. It turns out that the business profile of migrant entrepreneurship is changing from the first generation to the next one. This 'break-out' strategy positions migrant entrepreneurs in a mature competitive context, and heralds essentially a socio-economic emancipation of this class of entrepreneurs. Our study has identified the success conditions for business performance of this new class of migrant entrepreneurs.

Table 5 Profile of Turkish entrepreneurs in the ICT and the FIRE sector

		Share in total (%)
Personal characteristics		
Age	30-49	74
Education	vocational (middle and higher)	56
	university	35
	education place (NL)	83
	language ability (Dutch)	83
Arrival year	born	22
	1971-1980	52
Motivation and driving forces		
Position before start	employed	78
	entrepreneur	9
Previous sector	employee in the same sector	65
	entrepreneur in the same sector	4
	employee in a different sector	17
Sector choice	GAP/big demand	39
	experience	39
	education	22
Situation of the sector	growing/increasing	52
Turks in the sector	growing/increasing	30
	smaller/decreasing	48
The reason to be entrepreneur	to be independent/to be own boss	78
	flexibility	13
Entrepreneur in the family	yes	52
Capital sources	own capital	74
Information sources	own experience	61

Table 6 Profile of Turkish enterprises in the ICT and the FIRE sector

		Share in total (%)
Business characteristics		
Activities of the enterprise	ICT sector	70
	FIRE sector	30
Foundation year of the enterprise	1996-2000	39
	2001+	57
Number of employees	1-5	61
	6-15	35
Performance		
Development of sales	increase	91
Profit last year	positive	87
Profile of employees and clients		
Nationality of employees	Turkish employees	64
Preferences for employees	need for Turkish employees, because of Turkish clients	22
	preference for Dutch native employees	57
Composition of clients	80 % Turks – 20 % Natives	39
	Non-Turkish clients	35
Goals and strategies		
Target group	Turks	35
	Dutch natives and other groups	22
	no target group	35
Strategies	growth and more products and services	57
	specialization	30

Table 7 Classification of explanatory variables/attributes

ATTRIBUTES*		
PERSONAL CHARACTERISTICS	A7. Previous sector	ORIENTATION
A1. Age	1 = Employee in the same sector	A13. Nationality of employees
1 = 20-29	2 = Employee in a different sector	1 = Only Turks
2 = 30-39	3 = Entrepreneur in the same sector	2 = Only Dutch natives
3 = 40-49	4 = Entrepreneur in a different sector	3 = More Turks than Dutch natives
4 = 50>	5 = Student	4 = More Dutch natives than Turks
A2. Generation	A8(D2). Sectoral choice	5 = Other
1 = First generation	1 = GAP/Big demand	A14. Trust
2 = Second generation	2 = Sufficient knowledge/info; work experience	1 = Need for Turkish employees
A3. Education Level	3 = Sufficient knowledge/info; education	2 = No Turkish employees at all
1 = Secondary education	A9. Situation of the sector	3 = Preference for Turkish employees
2 = Middle vocational training	1 = Growing/increasing	4 = Preference for Dutch native employees
3 = High vocational training	2 = Smaller/decreasing	A15. Nationality of clients
4 = University	3 = Changes a lot	1 = Only Turks
A4. Education Place	4 = High competition	2 = Only Dutch natives
1 = The Netherlands	A10. Turks in the sector	3 = More Turks than Dutch natives
2 = Turkey	1 = Growing/increasing	4 = More Dutch natives than Turks
3 = Other	2 = Smaller/decreasing	5 = Other
MOTIVATION AND DRIVING FORCES	3 = No idea	A16. Target group
A5. Position before start	A11. Entrepreneur family member	1 = Yes, Turks
1 = Employed	1 = Yes	2 = Yes, Dutch natives and other groups
2 = Unemployed	2 = No	3 = Mixed
3 = Entrepreneur		4 = No
4 = Student	A12. Information sources	A17(D1). Sector
A6. Previous experience	1 = Own experience	1 = ICT sector
1 = Through employment	2 = Relatives and family	2 = FIRE sector
2 = Through entrepreneurship & employment	3 = Formal institutions and fellow entrepreneurs	
3 = Through school or study	4 = Combination of 1,2,3

Table 10 Frequency of attributes in reducts for sector and sectoral choice

Sector			Sectoral Choice		
Attribute	Frequency (#)	Frequency (%)	Attribute	Frequency (#)	Frequency (%)
A3	1	10	A4	1	10
A4	2	20	A7	2	20
A6	1	10	A9	1	10
A8	3	30	A10	3	30
A9	2	20	A11	2	20
A10	2	20	A12	2	20
A11	3	30	A13	8	80
A12	2	20	A14	8	80
A13	3	30	A15	4	40
A14	10	100	A16	5	50
A15	4	40	A17	4	40
A16	9	90			

Legend:

A3:	Education level	A11:	Entrepreneur family member
A4:	Education place	A12:	Information sources
A6:	Previous experience	A13:	Nationality of employees
A7:	Previous sector	A14:	Preferences for employees
A8:	Sectoral choice	A15:	Nationality of clients
A9:	Situation of the sector	A16:	Target group
A10:	Turks in the sector	A17:	Sector

Table 11 Accuracy and quality of the classification for sector and sectoral choice

Sector			
Class	Accuracy	Lower approximation	Upper approximation
ICT	1	17	17
FIRE	1	6	6
Accuracy of classification:		1	
Quality of classification:		1	
Sectoral Choice			
Class	Accuracy	Lower approximation	Upper approximation
Demand	1	9	9
Education&Experience	1	14	14
Accuracy of classification:		1	
Quality of classification:		1	
NOTE: The accuracy for each class is the lower divided by the upper approximation.			

Table 12 Rules generated by the rough set analysis for sector and sectoral choice

Rules	Description of rules	Strength (#)	Strength (%)
Sector			
rule 1	(A7 = 1) & (A11 = 2) => (D1 = 1)	8	47.06
rule 2	(A1 = 2) & (A8 = 2) => (D1 = 1)	7	41.18
rule 3	(A1 = 1) & (A11 = 1) => (D1 = 1)	3	17.65
rule 4	(A8 = 1) & (A10 = 1) & (A15 = 3) => (D1 = 2)	3	50.00
rule 5	(A4 = 1) & (A7 = 1) & (A15 = 3) => (D1 = 2)	3	50.00
Sectoral Choice			
rule 1	(A12 = 1) & (A15 = 3) => (D2 = 1)	5	55.56
rule 2	(A7 = 4) => (D2 = 1)	4	44.44
rule 3	(A4 = 1) & (A5 = 1) & (A17 = 1) => (D2 = 2)	9	64.29
rule 4	(A3 = 4) & (A14 = 4) => (D2 = 2)	5	35.71

Table 13 Description of significant rules and the most important factors behind orientation and sectoral choice of Turkish entrepreneurs

RULES	IF				THEN
Sector					
Rule 1	previous sector: employee in the same sector	+	entrepreneur family: no		sector: ICT
Rule 2	age: 30-39	+	sectoral choice: education & experience		sector: ICT
Rule 3	age: 20-29	+	entrepreneur family: yes		sector: ICT
Rule 4	sectoral choice: demand	+	Turks in the sector: increasing	+	clients: more Turks
Rule 5	education place: Netherlands	+	previous sector: employee in the same sector	+	clients: more Turks
Sectoral Choice					
Rule 1	information source: own experience	+	clients: more Turks		sectoral choice: demand
Rule 2	previous sector: entrepreneur in different sector				sectoral choice: demand
Rule 3	education place: Netherlands	+	position before start: employed	+	sector: ICT
Rule 4	education level: university	+	preferences for employees: Dutch		sectoral choice: education&experience

Table 14 Most important factors in motivation, driving forces and sectoral choice of the second-generation Turkish entrepreneurs in the ICT and the FIRE sector

Rank of order	ICT/FIRE sector
1	Nationality of employees
2	Preferences of employees
3	Target group

Table 15 Determinant factors for sectoral choice

ICT sector	FIRE sector
Education attainment	Existence of Turkish entrepreneurs in the sector
Working experience	Existence of potential Turkish clients
